Abstract— Security of information plays a vital role in data transmission. For this purpose steganography and cryptography is plays a major role. Steganography embed a text into cover image and cryptography convert plain text into the cipher text vice versa. There are many algorithms that has been proposed for steganography and cryptography for safe transmission of the data. But intruder sometimes identify the secret message from the stego image. In the proposed system we apply BSS technique on secret message after to convert the cipher text using RSA algorithm. The cipher text is embedded into cover image using LSB technique, it generates stegano image.

Keywords—BSS, LSB, RSA, Encryption, decryption

I. INTRODUCTION

The word "Steganography" comes from the Greek and it means "covered or secret writing". As defined today, it is the technique of embedding information into something else for the sole purpose of hiding that information from the casual observer. In stego the information is hidden in the image whereas watermarking actually adds something to the image (like the word "Confidential"), and therefore becomes part of the image. Some people might consider stego to be related to encryption, but they aren't the same thing. We use encryption the technology to translate something readable to something unreadable to protect sensitive or confidential data. In stego the information is not necessarily encrypted, just hidden from plain view.

Steganography to hide it. This two-step process adds additional security. If someone manages to figure out the Steganography system used, he wouldn't be able to read the data, he extracted because it's encrypted.

The word "Steganography" comes from the Greek and it means "covered or secret writing". As defined today, it is the technique of embedding information into something else for the sole purpose of hiding that information from the casual observer. In stego the information is hidden in the image whereas watermarking actually adds something to the image (like the word "Confidential"), and therefore becomes part of the image. Some people might consider stego to be related to encryption, but they aren't the same thing. We use encryption the technology to translate something readable to something unreadable to protect sensitive or confidential data. In stego the information is not necessarily encrypted, just hidden from plain view.

1.2 LSB Technique

Least significant bit (LSB) insertion is a common and simple approach to embed information in an image file. In this method the LSB of a byte is replaced with an M’s bit. This technique works well for image steganography. To the human eye the stego image will look identical to the carrier image. For hiding information inside the images, the LSB (Least Significant byte) method is usually used. To a computer an image file is simply a file that shows different colors and intensities of light on different areas of an image. The best type of image file to hide information inside is a 24 Bit BMP (Bitmap) image. When an image is of high quality and resolution it is a easier to hide information inside image. Although 24 Bit images are best for hiding information due to their size. Some people may choose 8 Bit BMP’s or possibly another image format such as GIF. The reason being is that posting of large images on the internet may arouse suspicion. The least significant bit i.e. the eighth bit is used to change to a bit of the secret message. When using a 24 bit image, one can store 3 bits in each pixel by changing a bit of each of the red, green and blue color components. Suppose that we have three adjacent pixels (9 bytes) with the RGB encoding

```
10010101 00001101 11001001
10010110 00001111 11001011
10011111 00010000 11001011
```

When the number 300, can be which binary representation is 100101100 embedded into the least significant bits of this part of the image. If we overlay these 9 bits over the LSB of the 9 bytes above we get the following (where bits in bold have been changed)
Here the number 300 was embedded into the grid, only the 5 bits needed to be changed according to the embedded message. On average, only half of the bits in an image will need to be modified to hide a secret message using the maximum cover size.

The Fibonacci LSB Data Hiding Technique proposed by Battisti et al. investigates decomposition into a different set of bit-planes, based on the Fibonacci - p-sequences, given by,

\[ F_p(0) = F_p(1) = 1 \]

\[ F_p(n) = F_p(n-1) + F_p(n-p-1), \forall n \geq 2, n \in \mathbb{N} \]

and embed a secret message-bit into a pixel if it passes the Zeckendorf condition, then during extraction, follow the reverse procedure.

Data hiding technique using prime decomposition as an improvement over Fibonacci. Virtual bit-planes are generated using Prime Decomposition. The weight function of the Prime Number System is defined as:

\[ F(0) = 1, F(i) = p_i, \forall i \in \mathbb{Z}_p, \text{ where } p_i \text{ are } \text{Prime} \]

\[ p_1 = 2, p_2 = 3, p_3 = 5, ... \]

and embed a secret message-bit into a pixel if after embedding it still remains as a valid representation. It has been shown that this technique not only increases the options for embedding by increasing number of bit-planes but also gives less distortion than classical binary and Fibonacci Decomposition, while embedding message in higher bit-planes.

1. PROPOSED SYSTEM

A new system is proposed, wherein two popular techniques RSA and BSS are combined in steganography, which provide a better security. In this proposed system, we apply BSS technique on secret message and then convert it to cipher text using RSA algorithm. The cipher text is embedded into cover image using LSB technique, it generates stego image.

2.1 BSS

2.1.1 Bit shifting

Bit shifting[2] is an operation done on all the bits of a binary value in which they are moved by a determined number of places to either the left or right. Bit shifting is used when the operand is being used as a series of bits rather than as a whole.

In other words, the operand is treated as individual bits that stand for something and not as a value. Bit shifting is often used in programming and has at least one variation in each programming language. Bit shifting may also be known as a bitwise operation.

2.3.2 Bit stuffing

Bit stuffing is the process of inserting non-information bits into data to break up bit patterns to affect the synchronous transmission of information. It is widely used in network and communication protocols, in which bit stuffing is a required part of the transmission process. Bit stuffing is commonly used to bring bit streams up to a common transmission rate or to fill frames. Bit stuffing is also used for run-length limited coding. The system deals with security of data by using BSS encryption and decryption.

2.3.3 Sender Process

In this process every eight bytes of plain text becomes seven bytes of cipher text. So another advantage of this method is when it encrypts it reduces the size of the data. In this process let us consider I1, I2, I3, I4, I5, I6, I7 and I8 represents 8 printable characters of plain text and the values in the boxes represent the byte equivalent values of each character. i.e. a1, a2, a3, a4, a5, a6a7 represents 7 bits of character I1 and their value may be either 0 or 1. Similarly remaining character bits are represented in boxes as shown in figure 1. In this process the last character I8 bits h1, h2, h3, h4, h5, h6, h7 are shifted and stuffed into the characters I7, I6, I5, I4, I3, I2, I1 respectively as shown in figure.

For example the eight characters are a, b, c, d, e, f, g and h. i.e. I1 = A, I2 = B, I3 = C, I4 = D, I5 = E, I6 = F, I7 = G, and I8 = H.

The equivalent byte values of these characters before encryption are as follows:

I1 ASCII value 65 and its bits: 01000001, i.e. a1 = 1, a2 = 0, a3 = 0, a4 = 0, a5 = 0, a6 = 0, a7 = 1.

I2 ASCII value 66 and its bits: 01000010, i.e. b1 = 1, b2 = 0, b3 = 0, b4 = 0, b5 = 0, b6 = 1, b7 = 0.

I3 ASCII value 67 and its bits: 01000011, i.e. c1 = 1, c2 = 0, c3 = 0, c4 = 0, c5 = 0, c6 = 1, c7 = 1.

I4 ASCII value 68 and its bits: 01000100, i.e. d1 = 1, d2 = 0, d3 = 0, d4 = 0, d5 = 1, d6 = 0, d7 = 0.

I5 ASCII value 69 and its bits: 01000101, i.e. e1 = 1, e2 = 0, e3 = 0, e4 = 0, e5 = 1, e6 = 0, e7 = 1.

I6 ASCII value 70 and its bits: 01000110, i.e. f1 = 1, f2 = 0, f3 = 0, f4 = 0, f5 = 1, f6 = 1, f7 = 0.

I7 ASCII value 71 and its bits: 01000111, i.e. g1 = 1, g2 = 0, g3 = 0, g4 = 0, g5 = 1, g6 = 1, g7 = 1.

www.ijseat.com
18 ASCII value 72 and its bits: 01001000, i.e. h1=1, h2= 0, h3= 0, h4= 1, h5=0, h6= 0, h7= 0.

After encryption by using BSS method the equivalent byte values of these characters are as follows.

I1 bits: 01000001, i.e. h7 = 0, a1 = 1, a2 = 0, a3 = 0, a4 = 0, a5 = 0, a6 = 0, a7 = 1.
I2 bits: 01000010, i.e. b6 = 0, b1 = 1, b2 = 0, b3 = 0, b4 = 0, b5 = 0, b6 = 1, b7 = 0.
I3 bits: 01000011, i.e. h5 = 0, c1 = 1, c2 = 0, c3 = 0, c4 = 0, c5 = 0, c6 = 1, c7 = 1.
I4 bits: 11000100, i.e. h4 = 1, d1 = 1, d2 = 0, d3 = 0, d4 = 0, d5 = 1, d6 = 0, d7 = 0.
I5 bits: 01000101, i.e. h3 = 0, e1 = 1, e2 = 0, e3 = 0, e4 = 0, e5 = 1, e6 = 0, e7 = 1.
I6 bits: 01000110, i.e. h2 = 0, f1 = 1, f2 = 0, f3 = 0, f4 = 0, f5 = 1, f6 = 1, f7 = 0.
I7 bits: 11000111, i.e. h1 = 1, g1 = 1, g2 = 0, g3 = 0, g4 = 0, g5 = 1, g6 = 1, g7 = 1.

2.3.4. Receiver Process

In decryption process every seven bytes of cipher text produces eight characters of plain text. So after decryption process the decrypted data will automatically get its original size. The following figure 3 shows data before decryption, and figure 4 shows the data after decryption.

A. Maintaining the Integrity of the Specifications

The template is used to format your paper and style the text. All margins, column widths, line spaces, and text fonts are prescribed; please do not alter them. You may note peculiarities. For example, the head margin in this template measures proportionately more than is customary. This measurement and others are deliberate, using specifications that anticipate your paper as one part of the entire proceedings, and not as an independent document. Please do not revise any of the current designations.

II. EXPERIMENTAL RESULTS

In this paper, an attempt is made to compare the original image with the image only by applying LSB steganography, RSA-LSB steganography, BSS-LSB steganography and BSS-RSA-LSB steganography by using various statistical methods.

IV. CONCLUSION

The proposed system used in this project encrypts the secret message before we apply the BSS technique after embedding into the image. From the analysis we compared RSA with BSS and without BSS based on mean, correlation coefficient and Chi-square methods and conclude that RSA with BSS is suitable for secret message hiding in Steganography.
